

NPX & SASS GUIDE (UPDATED)

1. What is npx?

npx (Node Package Execute) is a tool that comes with Node.js.

It allows you to run npm packages without installing them globally.

Example:

```
npx create-react-app my-app
```

2. Sass with npx (Single File)

style.scss → style.css

Command:

```
npx sass style.scss style.css
```

3. Sass with npx (Folder)

Command:

```
npx sass scss:css
```

Watch Mode:

```
npx sass --watch scss:css
```

4. Using Sass with npm (Installation)

Install locally:

```
npm install sass
```

This installs Sass inside your project.

5. Sass with npm (Single File)

Use npx (recommended even after install):

```
npx sass style.scss style.css
```

OR define script in package.json:

```
"scripts": {  
  "sass": "sass style.scss style.css"  
}
```

Run:

```
npm run sass
```

6. Sass with npm (Folder)

```
"scripts": {  
  "sass": "sass scss:css"  
}
```

Run:

```
npm run sass
```

7. Watch Mode with npm

```
"scripts": {  
  "sass:watch": "sass --watch scss:css"  
}
```

Run:

```
npm run sass:watch
```

Summary:

- npx = run without install
- npm = install locally and manage scripts
- Sass = compile SCSS → CSS
